AI Quality Agent — live console

https://sanket-dhamke.github.io/sanket-qa-portfolio/index.html

Dear Hiring Manager,

I am a Lead QA Automation Engineer with 12 years in QA automation, focused on AI-enabled testing. I design UI and API automation in Python, Playwright, and Selenium, and I want the next role to use that craft on a product where quality is a system — not a coverage percentage.

The live console on this letter is a personal DataHub OSS demo I built from scratch — not an employer product. In chat you can ask the current status of the application, any security issues, any performance issues, or run an existing feature the way a customer would — for example, ingest a Postgres database and provide the YAML recipe. Security checks the code at a known version and the running app after Connect (unauthenticated APIs, secrets in logs), using the same chat and RCA as performance. This agent can be configured for any product.

At BMC Software (February 2023 – September 2026) I was Lead Automation Engineer in R&D. I built a hybrid AI-assisted testing agent for Beacon: Playwright for UI, Python/pytest for API, rule- and regex-based routing, and a repository-derived JSON API catalog. I did not build Beacon from scratch; I built the agent that tests it, plus monitoring of Kubernetes and Docker pod CPU and memory, and I used execution evidence to investigate ingestion and pipeline failures.

Before BMC I led automation across product groups as a Senior SDET at ACI Worldwide, designed a Selenium/Python UI framework with Jenkins at TIBCO, and built pytest automation for backup and recovery REST APIs at Dell EMC. I am looking for a Lead QA / SDET role where I still write the framework and also set the quality line: what to automate first, what a release gate means, and how failures get investigated.

I would welcome a conversation about how I can contribute.

Yours sincerely,
Sanket Dhamke
